

# Beauty hardon production in Pb-Pb collisions with Bayesian unfolding

Guangsheng Li

University of Science and Technology of China

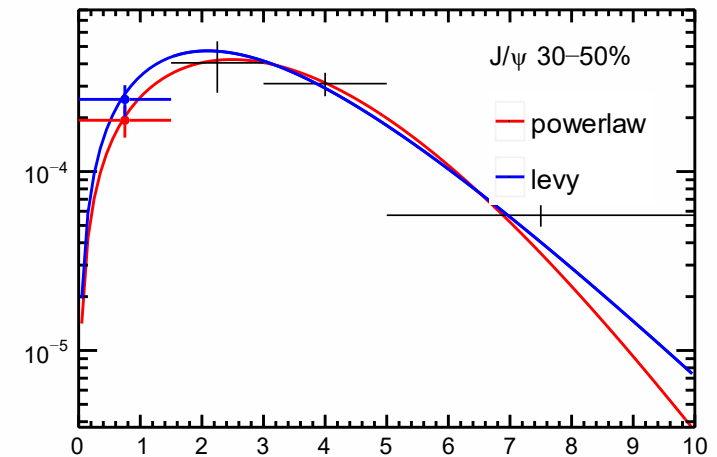

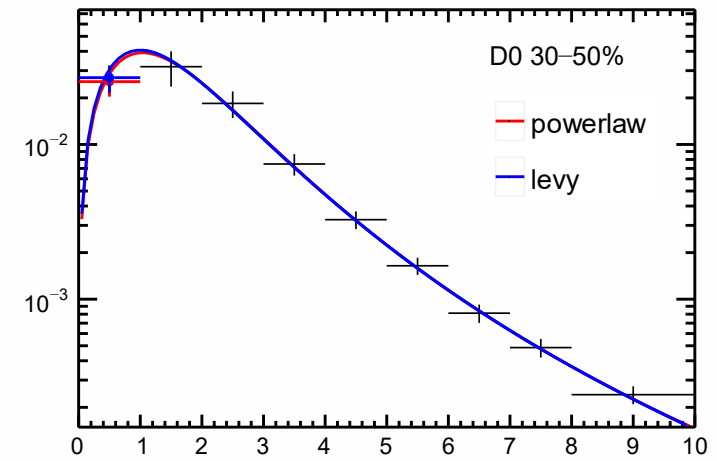

# Outline

- Extrapolation
- $B$   $p_T$  reweight
- Difference between D0 and Jpsi channel
- Propagation of syst. uncertainty
- $p_T$ -intergrated  $b\bar{b}$  production

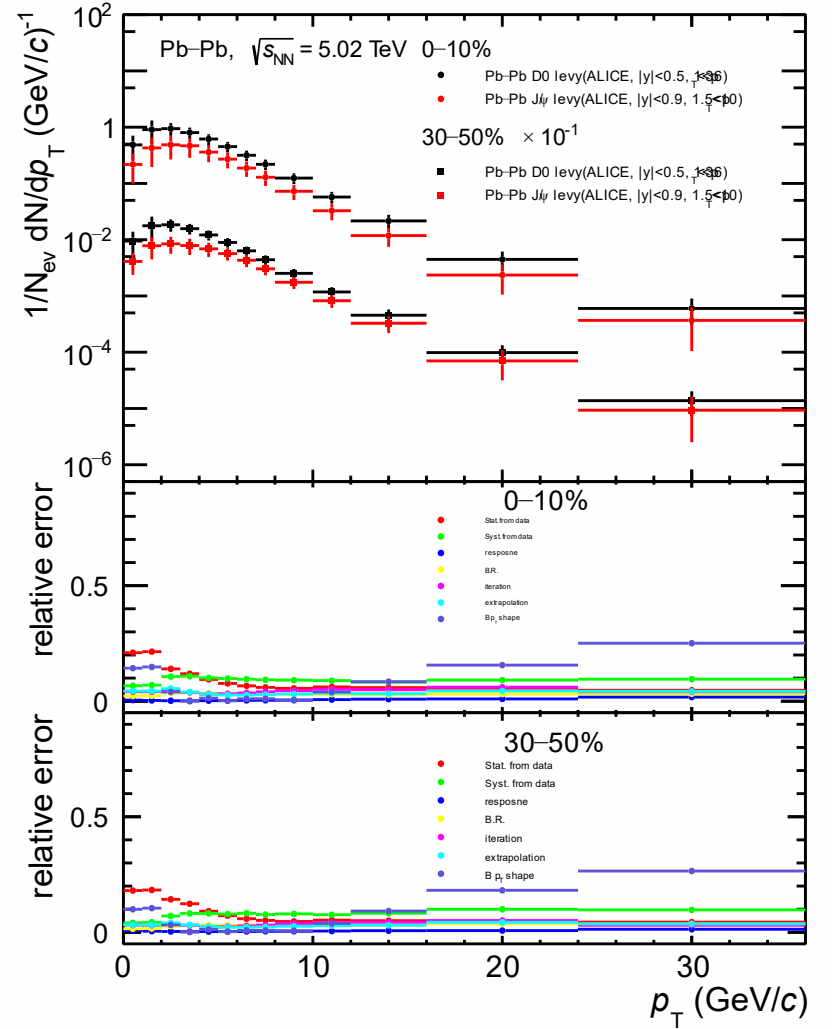

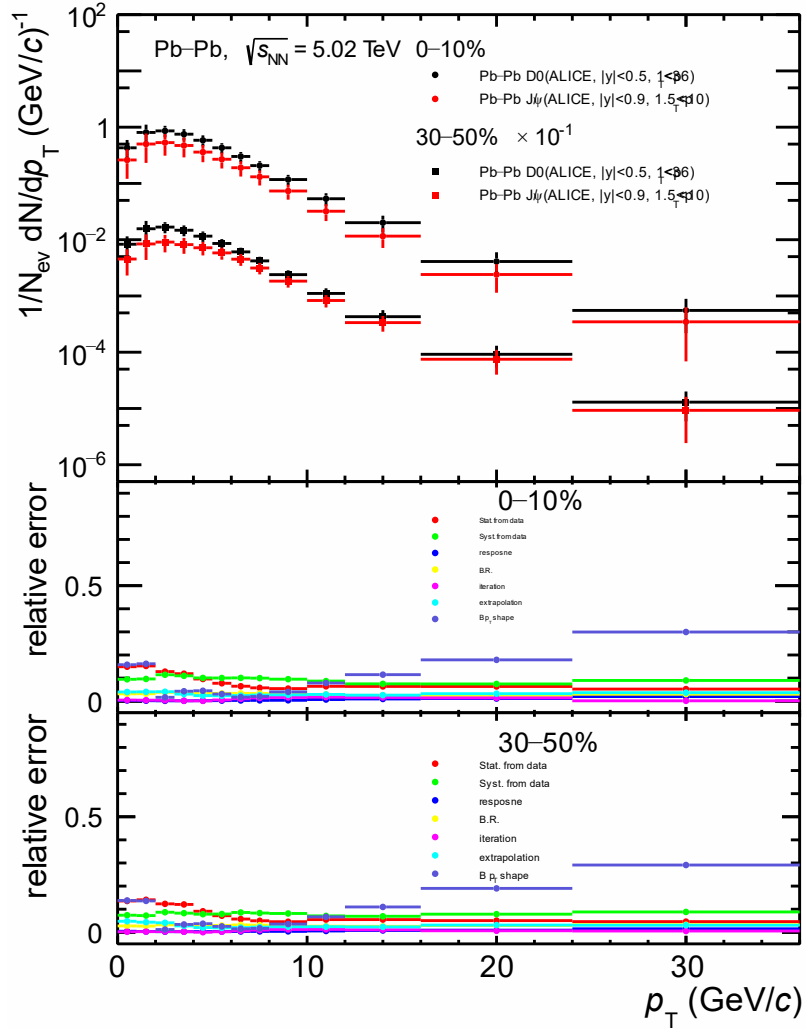

# Extrapolation

# Ratio of $b\bar{b}$ production from extrapolation

# Uncertainties analysis from extrapolation

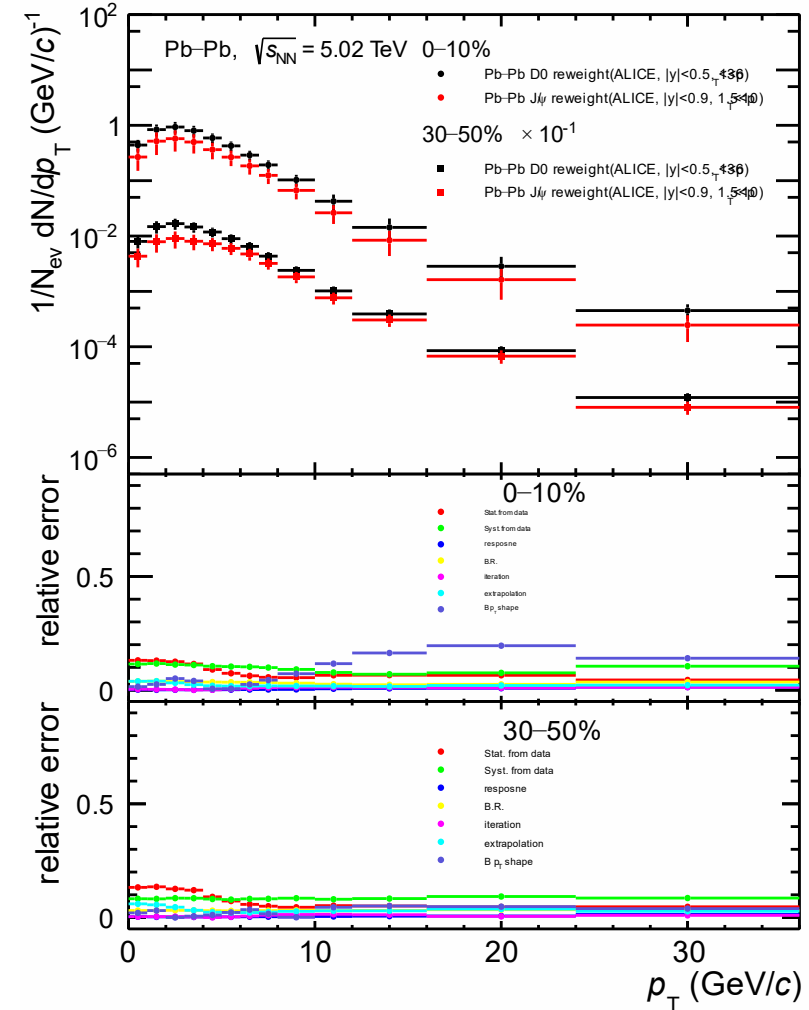

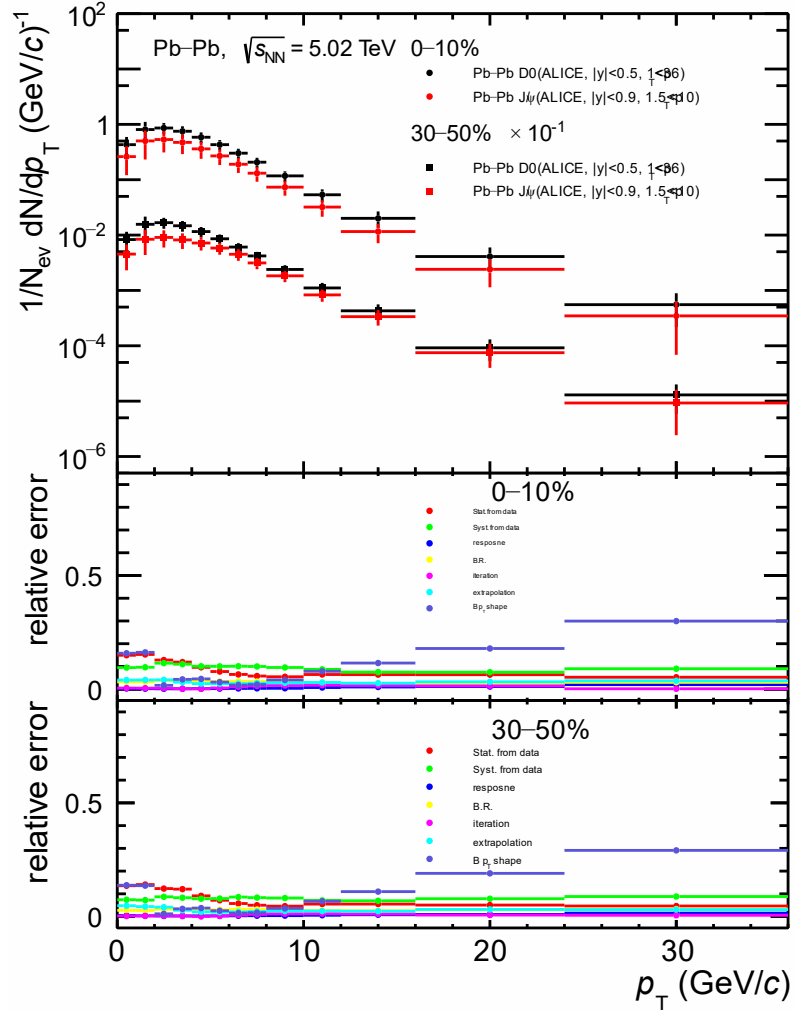

# RAA from extrapolation

# B $p_T$ reweight

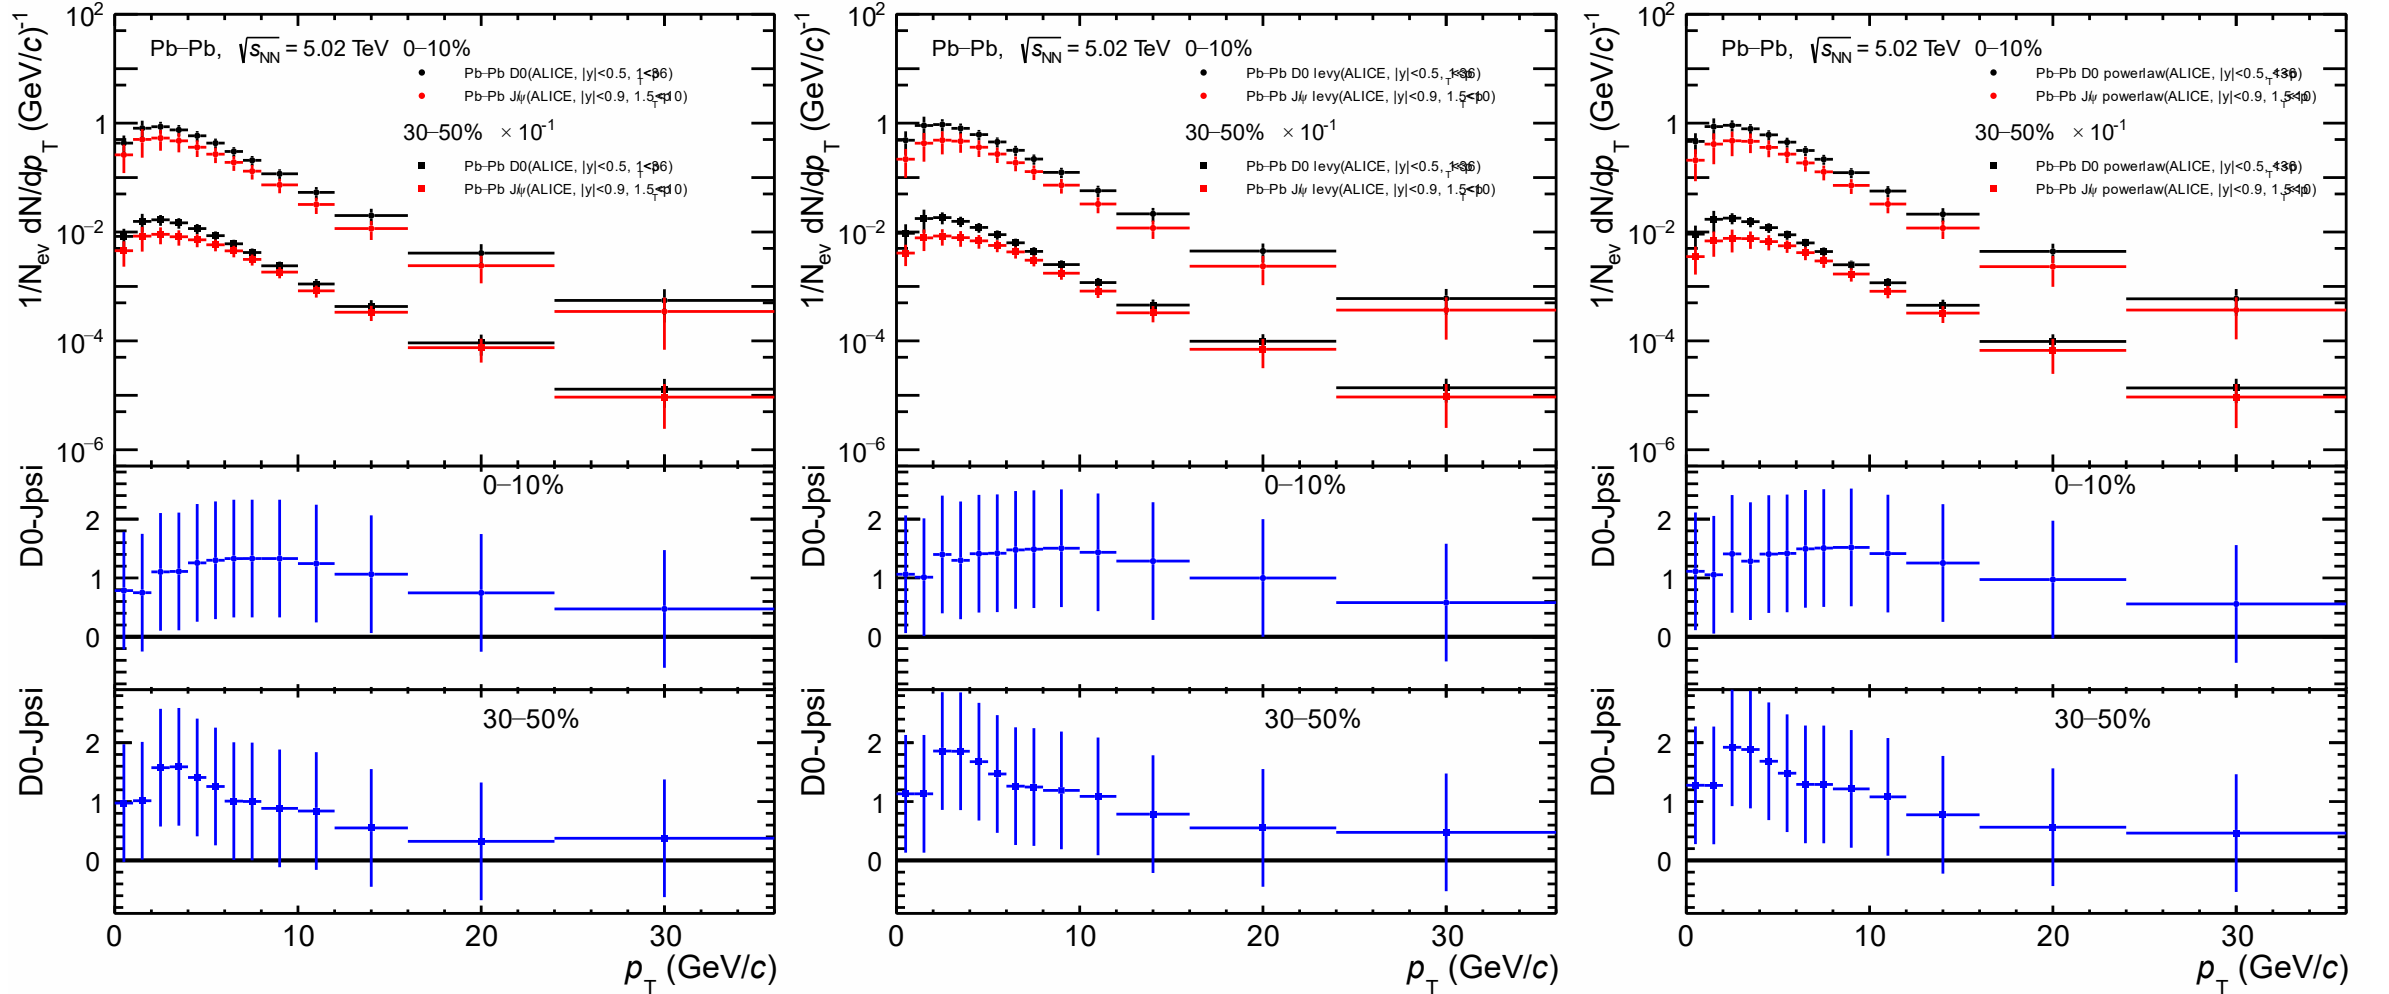

# Uncertainties analysis from reweight

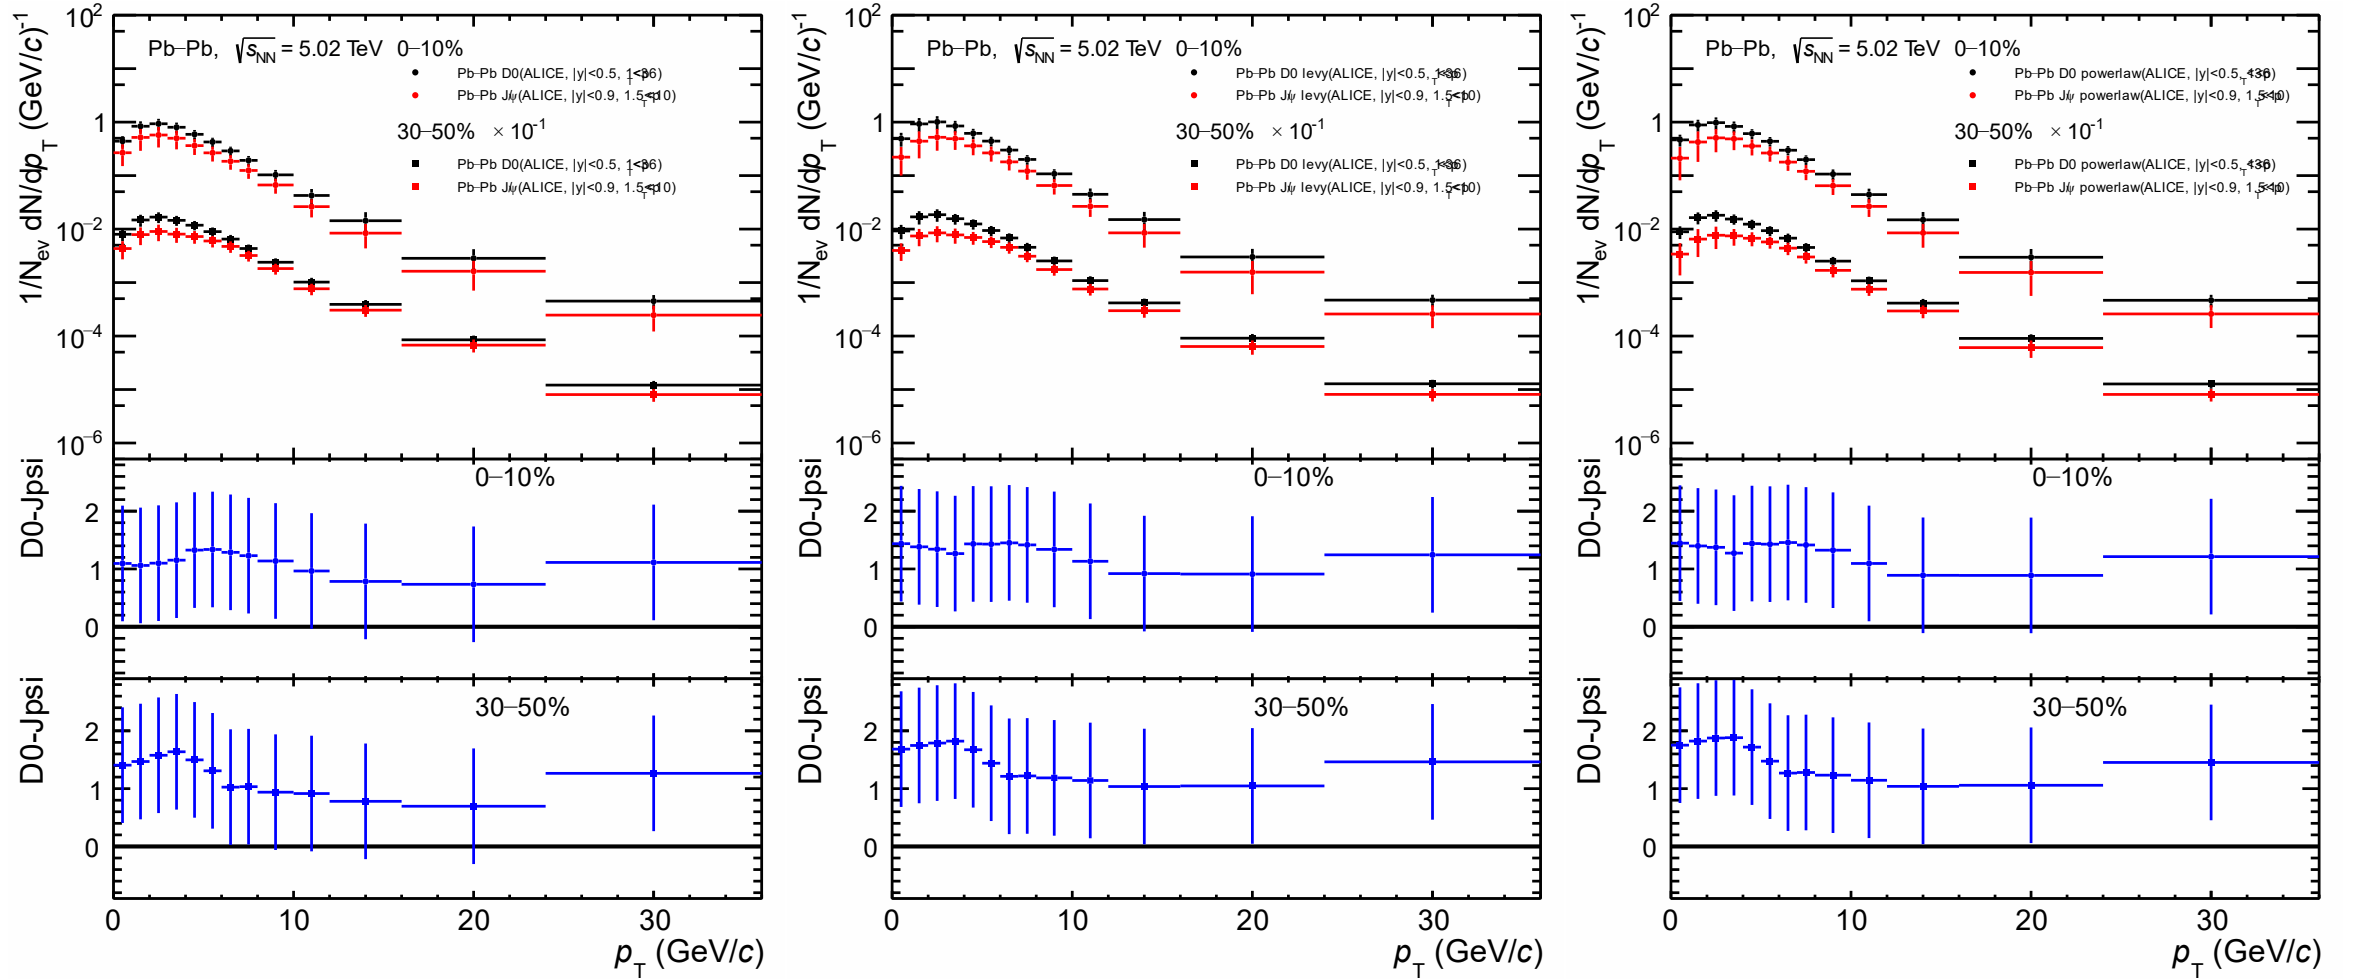

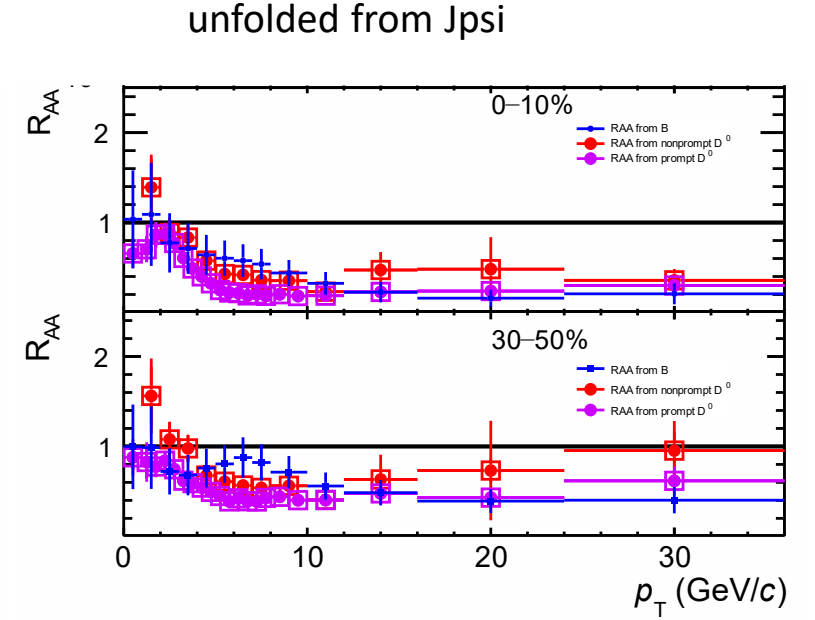

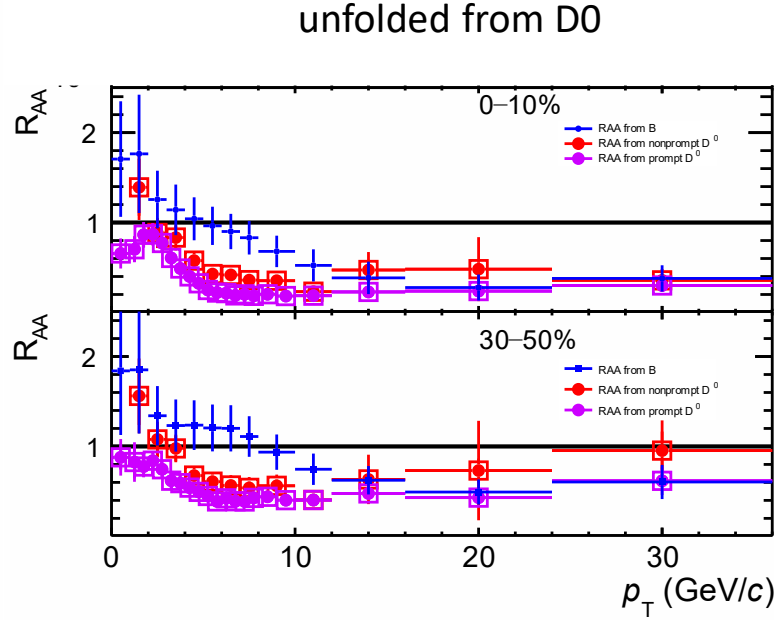

# Difference between D0 and Jpsi channel (w/o weight)

# Difference between D0 and Jpsi channel (with weight)

# Jpsi /D0 and RAA from different channel

# Propagation of syst. uncertainty

propagation separately similar as stat. uncertainty

Syst. Error matrix (fully correlated)

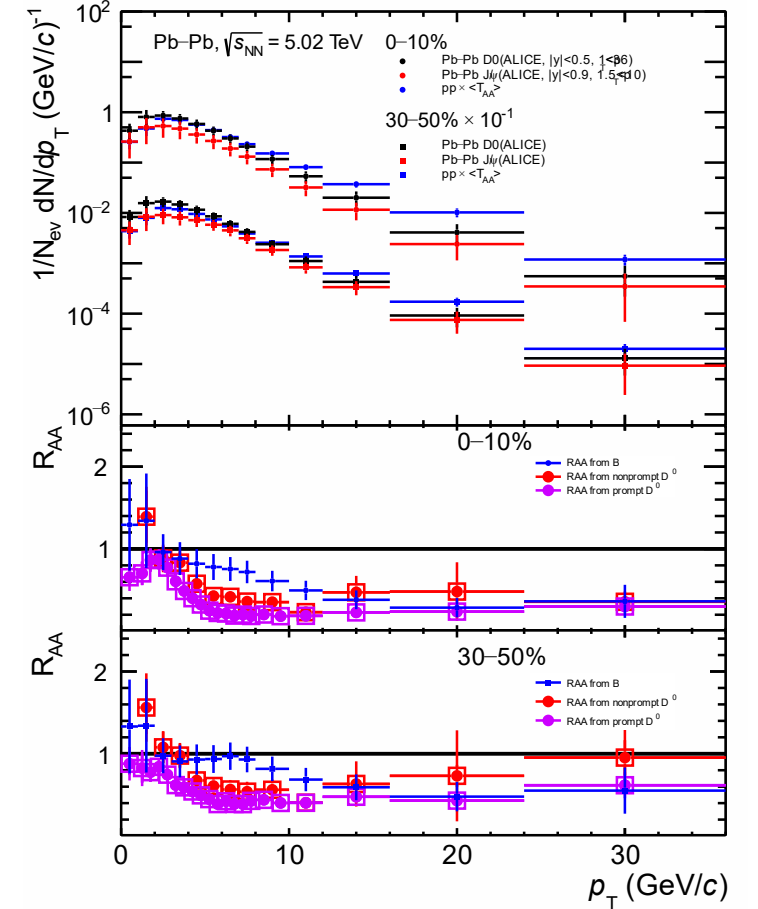

$$\begin{pmatrix} \sigma_{1,syst}^2 & \cdots & \sigma_{1,syst}\sigma_{n,syst} \\ \vdots & \ddots & \vdots \\ \sigma_{1,syst}\sigma_{n,syst} & \cdots & \sigma_{n,syst}^2 \end{pmatrix}$$

Add up syst. Error matrix from every source

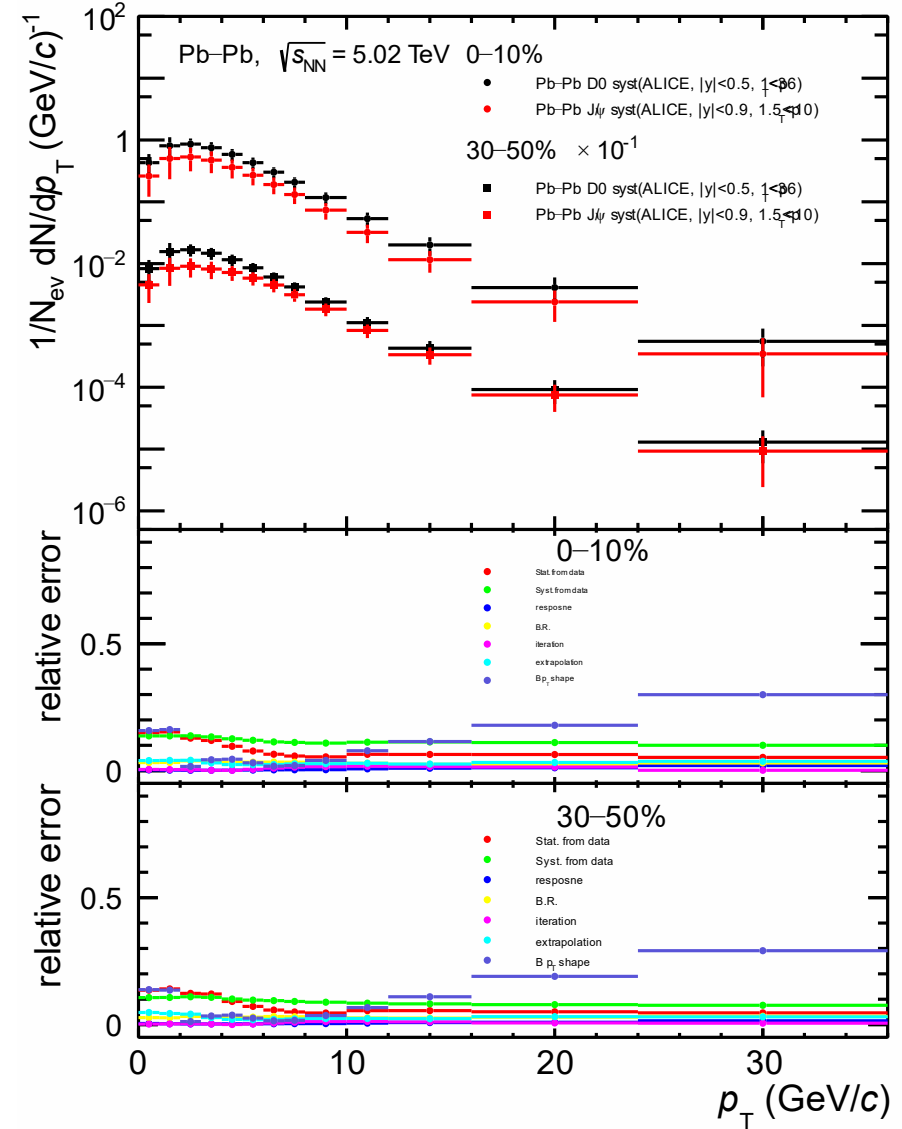

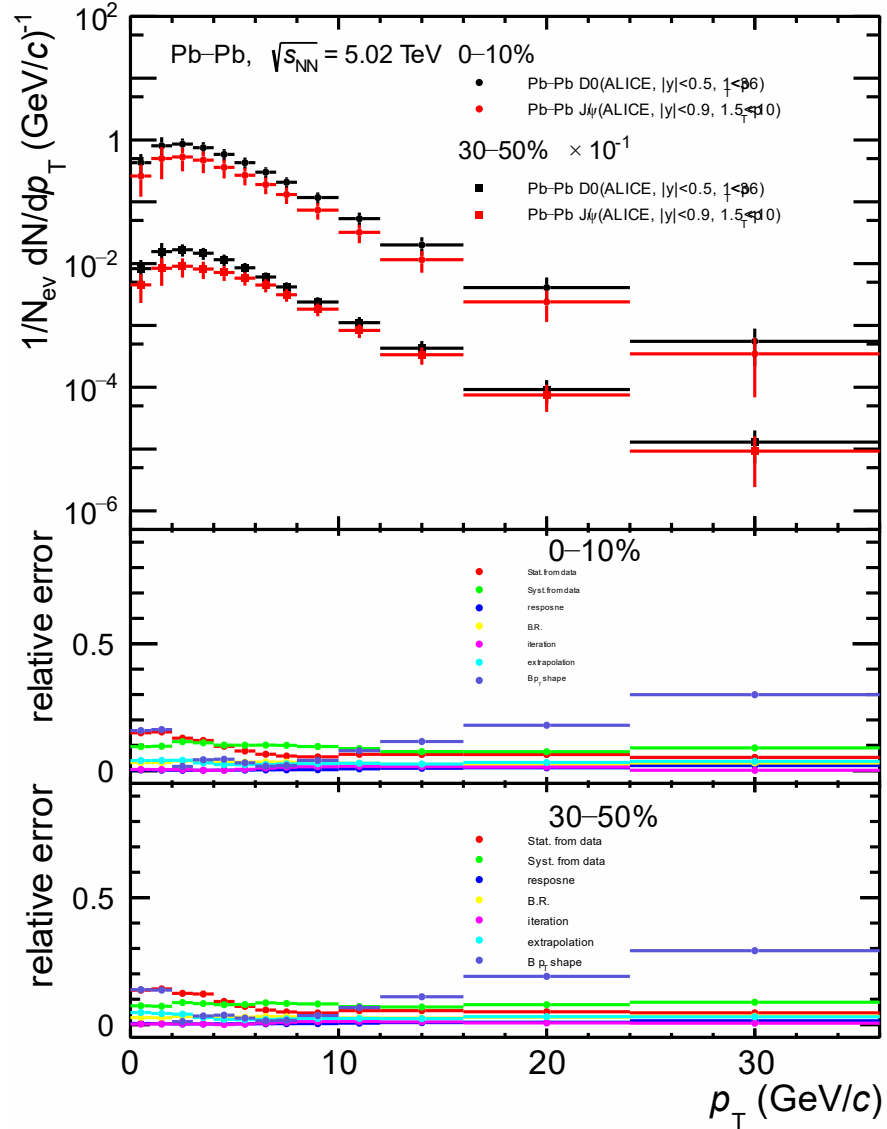

Stat. Error matrix

$$\begin{pmatrix} \sigma_{1,stat}^2 & \cdots & 0 \\ \vdots & \ddots & \vdots \\ 0 & \cdots & \sigma_{n,stat}^2 \end{pmatrix}$$

treat as global uncertainty  $\frac{\sum \sigma_i}{\int dN/dp_T}$

# Uncertainties analysis from different syst. propagation

# $p_T$ -intergrated $b\bar{b}$ production

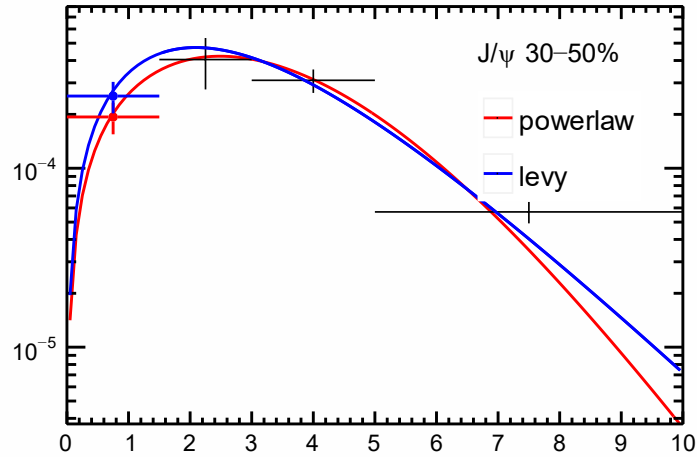

0-10%:  $0.88 \pm 0.02$

30-50%:  $0.98 \pm 0.03$

# Branching ratio

$\Lambda_b \rightarrow D^0$	$(6.65 \pm 0.68) \times 10^{-4}$
$\Lambda_b \rightarrow J/\psi$	$(5.8 \pm 0.8) \times 10^{-5}$
$B_s \rightarrow D^0$	$(38 \pm 10) \%$
$B_s \rightarrow J/\psi$	$< 5.57 \times 10^{-3}$
$B_c \rightarrow D^0$	$< 4.48 \times 10^{-3}$
$B_c \rightarrow J/\psi$	seen

let the [1.5-3] point times 1.1  
(relative statistical error is about 10%)

# Mean Pt
